## 1. ExCriticalSection 소스코드

```
#define _WINSOCK_DEPRECATED_NO_WARNINGS
#include <windows.h>
#include <stdio.h>
#define MAXCNT 100000000 // 100,000,000
int g_count = 0;
CRITICAL_SECTION cs;
DWORD WINAPI MyThread1(LPVOID arg)
         for (int i = 0; i < MAXCNT; i++)
         {
                   EnterCriticalSection(&cs);
                   g_count += 2;
                   LeaveCriticalSection(&cs);
         return 0;
}
DWORD WINAPI MyThread2(LPVOID arg)
{
         for (int i = 0; i < MAXCNT; i++)
                   EnterCriticalSection(&cs);
                   g_count -= 2;
                   LeaveCriticalSection(&cs);
         return 0;
}
int main(int argc, char* argv[])
{
         // 임계 영역 초기화
         InitializeCriticalSection(&cs);
         // 스레드 두 개 생성
         HANDLE hThread[2];
         hThread[0] = CreateThread(NULL, 0, MyThread1, NULL, 0, NULL);
         hThread[1] = CreateThread(NULL, 0, MyThread2, NULL, 0, NULL);
         // 스레드 두 개 종료 대기
         WaitForMultipleObjects(2, hThread, TRUE, INFINITE);
```

```
// 임계 영역 삭제
DeleteCriticalSection(&cs);

// 결과 출력
printf("g_count = %d\n", g_count);
return 0;
}
```

## ExCriticalSection 실행결과
